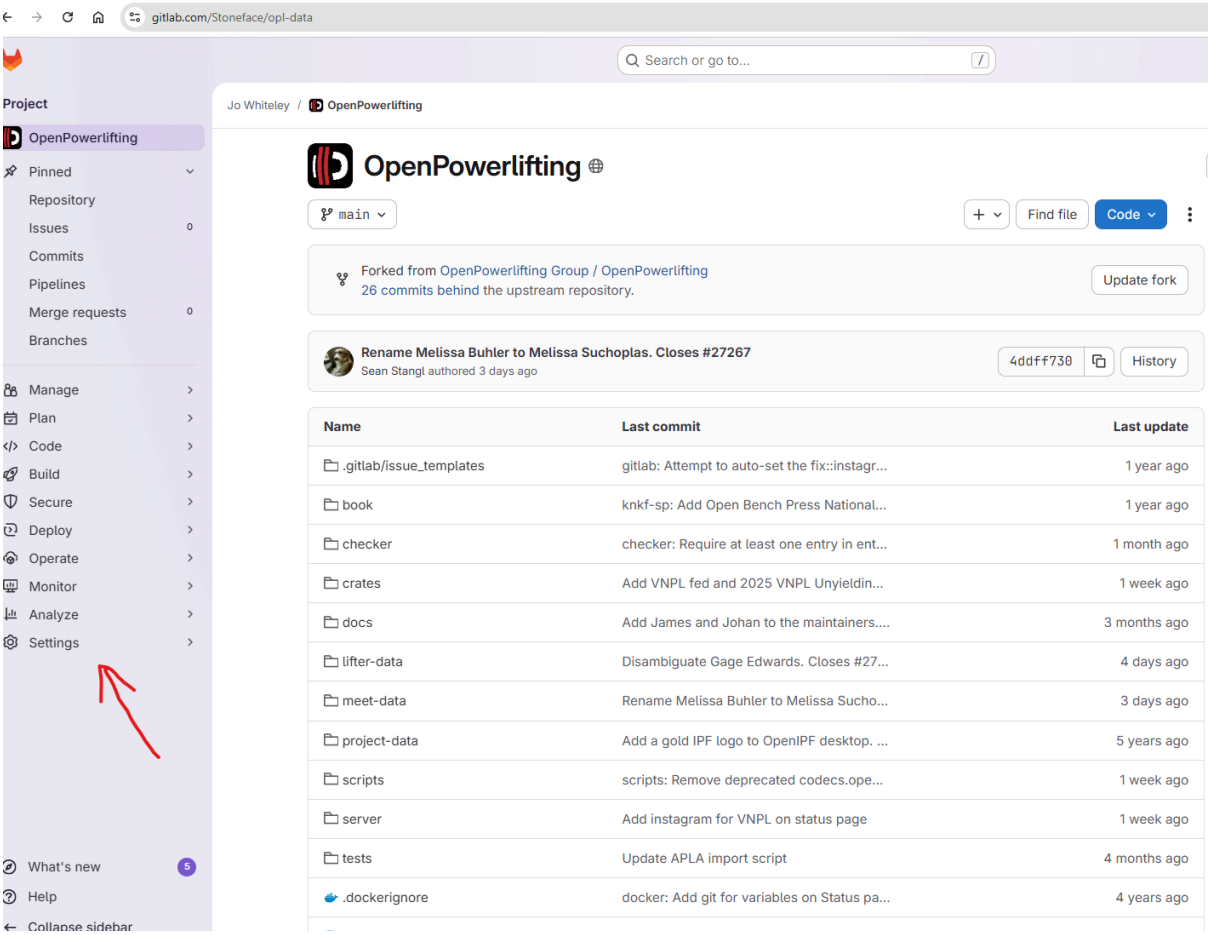
So you have committed to your main branch….

Don't worry, we've all done it. Here's the easiest way to fix it. Delete everything.

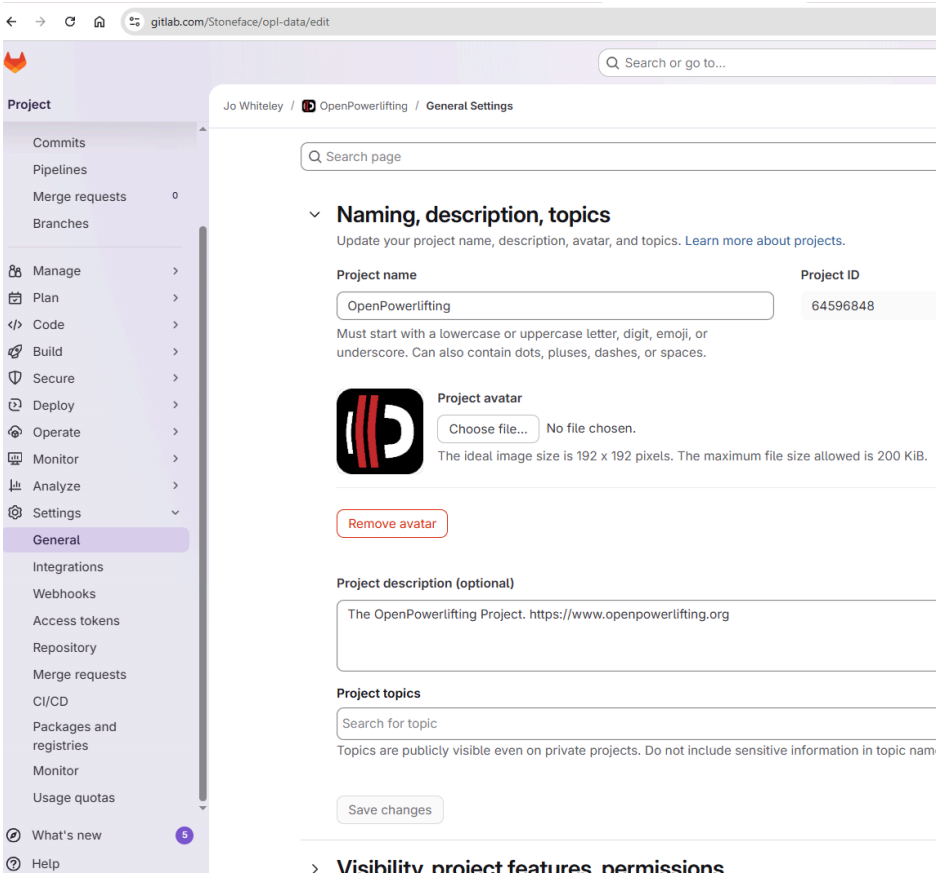
It sounds dramatic but if you think that you are repeatedly taking a snapshot of the project to work on, submitting it to be merged, and pulling an update, it's not much different. You are just ditching a slightly corrupted copy and getting a fresh new one.

Here's how to do it. Go to your own page on Gitlab, rather than the project page. Check the URL on the screenshot below and substitute your own user name. You can see that my main branch is 28 commits behind the upstream repository. If you have committed to main, yours may also say X commits ahead. This is your indicator that you have committed to main.

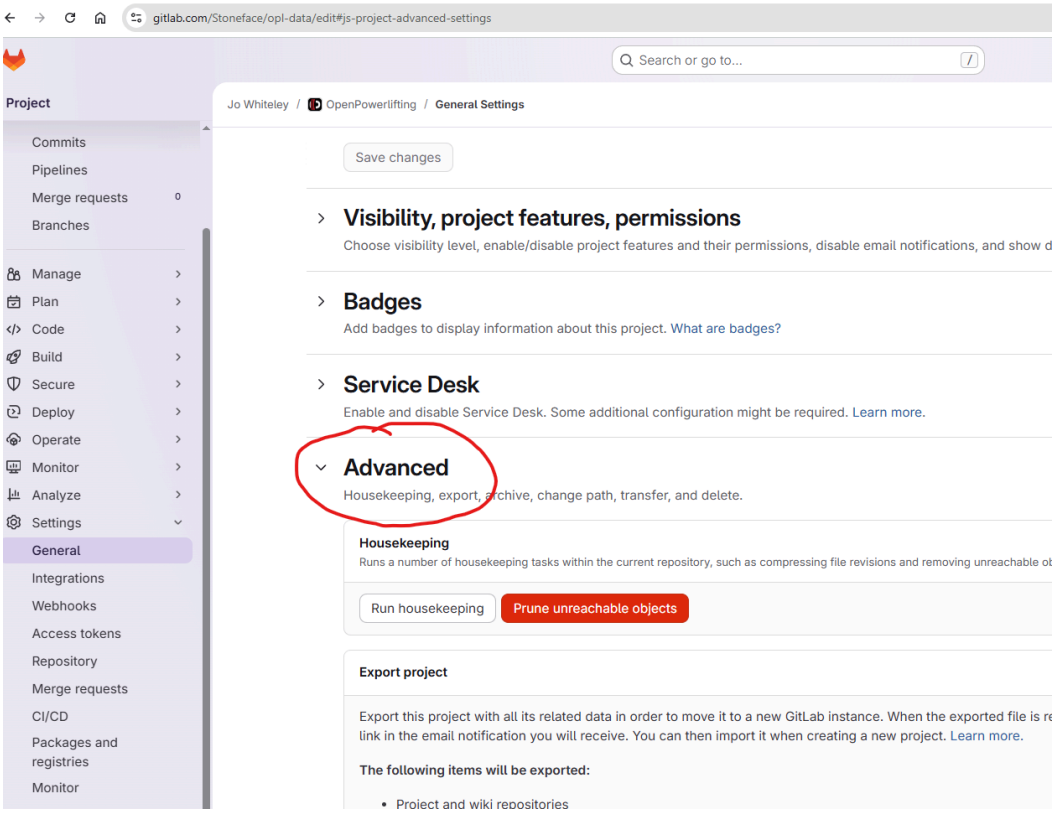
Go to settings bottom left



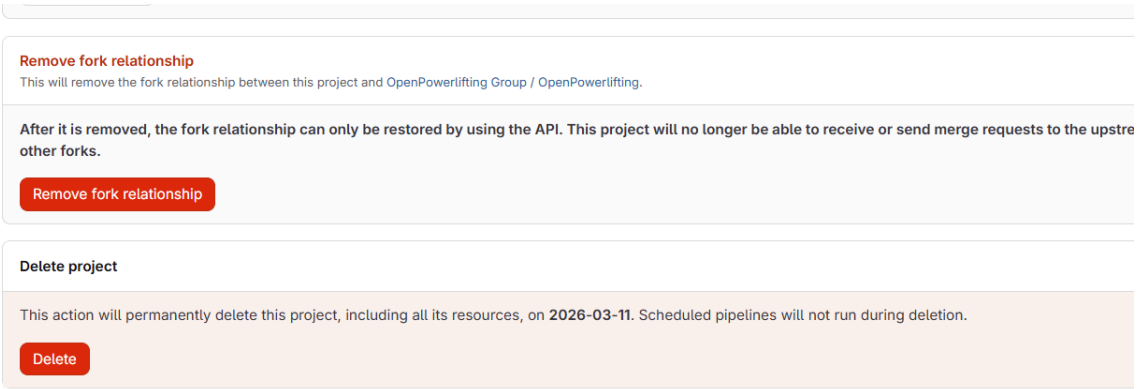
and select “general”.



Scroll down and choose “Advanced”



Scroll right to the bottom and click “Delete”



You will get all manner of dire warnings but confirm your choice and your repo will be deleted. Sometimes there is a delay before the repo is deleted.

Once it has actually been deleted, you can fork the project again and get a fresh new copy.
